

Group10-PA3 Peer Review

Requirement 3 | Lecturer Feedback and Group Reflection

Group	Group 10
Project	FIFA.com Ticket Confidence + Chess.com Beginner Review
Review source	Class presentation feedback
Reviewer	Lecturer
Scope	Paper prototypes, interaction flows, design-selection discussion

1. Overall Presentation Feedback

The lecturer gave positive feedback on the overall presentation. Each prototype was supported by both presentation slides and the corresponding design image. The group also explained the interaction flow directly on each prototype, which helped make the purpose and differences between the alternatives easier to follow.

Aspect	Lecturer Feedback
Presentation	Clear and well prepared.
Prototype coverage	Each alternative was presented with sufficient design detail.
Visual support	Slides and prototype images were both used.
Flow explanation	The interaction flow was explained directly on the prototype.

2. Lecturer Feedback on the Prototype Flows

Scenario	Lecturer View	Reason / Observation
FIFA.com	Alt 1 - Status Dashboard	Presented as the most suitable FIFA flow.
Chess.com	Alt 1 - Beginner Review Flow	Presented as the most suitable Chess flow.

This feedback reflects the lecturer's assessment of the flows presented in class. It is kept separate from the group's own design preference and the novice interview trend.

3. Design Preference Discussion

The group interviewed five random people who did not have prior knowledge of the interface design being developed. The table separates the most common interview trend from the group's own judgement and the lecturer's assessment during the presentation.

Perspective	FIFA Preference	Chess Preference
Group's design judgement	Alt 1 - Status Dashboard	Alt 3 - AI Review Assistant
Interview trend from 5 novice interviewees	Alt 1 - Status Dashboard	Alt 2 - Card Review Mode

Perspective	FIFA Preference	Chess Preference
Lecturer's flow assessment	Alt 1 - Status Dashboard	Alt 1 - Beginner Review Flow

For FIFA, all three perspectives pointed toward Alt 1, so there was little disagreement about the status-first direction.

For Chess, the three perspectives differed. The group initially preferred Alt 3, the interview trend favored Alt 2, while the lecturer considered Alt 1 the strongest flow during the presentation.

4. Lecturer Question

DISCUSSION QUESTION, PARAPHRASED

Why did the group's preferred Chess design differ from the option preferred by the people interviewed|

5. Group Response and Reflection

Our original preference was Chess Alt 3 because the chat-based assistant supports deeper analysis. A user can ask why a move was wrong, request another explanation, and explore the position in more detail. From the group's point of view, this made the design feel more accurate, flexible, and multi-functional. We were also drawn to the depth and detailed explanations that the assistant could provide.

The interview trend was different. The novice interviewees preferred Chess Alt 2 because the important moments were already organized into visible cards. They did not need to decide what question to type or how deeply to analyse the position before receiving useful information. A user could select a saved moment immediately, which reduced decision effort and felt more convenient for a new player.

This difference showed us that our own familiarity with the problem affected our design judgement. In this small interview set, novice users placed more value on convenience, simplicity, and ease of scanning, while the group placed more value on accuracy, depth, flexibility, and more detailed explanation. The result was an important reminder that knowing more about a domain can make a complex option feel more natural to its designers than it feels to someone seeing the problem for the first time.

6. Main Design Insight

Novice tendency observed in interviews	Group tendency
Simple entry	Detailed exploration
Visible saved moments	Open-ended questioning
Low decision effort	More user control
Convenience	Flexibility
Quick understanding	Deeper explanation

Based on this small, five-person interview set, the group should not assume that the most feature-rich or flexible design is automatically the easiest design for a new player.

7. Response and Action

Feedback / Question	Group Response	Action / Design Implication
Presentation was clear and each flow was shown directly on the prototype.	The group agreed that explaining the flow on the design made the alternatives easier to compare.	Keep this presentation approach for future prototype reviews.
FIFA Alt 1 was the strongest FIFA flow.	This matched both the group's judgement and the interview trend.	Keep the status-first structure as the main FIFA direction.
The lecturer asked why the group's Chess preference differed from the interviewees.	The group identified a difference between experienced, design-oriented expectations and a novice preference for convenience.	Give more weight to novice learnability, first-step clarity, and decision effort when comparing Chess alternatives.
Chess interviewees tended toward Alt 2 although the group preferred Alt 3.	Alt 2 reduces the need to formulate questions and exposes saved moments directly.	Carry the card-based simplicity and visible priority cues into later Chess design decisions, even when retaining deeper explanation features.

8. Conclusion

The peer review confirmed that the six alternatives were presented clearly, but the discussion also exposed an important design bias. FIFA Alt 1 had strong agreement across the group, lecturer, and interview trend. Chess produced different preferences depending on perspective. The group therefore concluded that future decisions should place more weight on novice simplicity, first-step clarity, and convenience instead of assuming that greater flexibility or functionality is always better.

Requirement 3 feedback record

Commenter: Lecturer | Role: Course Lecturer

Commenter	Feedback / Question	Group Response	Change / Action
Lecturer (Course Lecturer)	The presentation was good, with sufficient detail across the six prototypes, and the flows were explained directly on the designs.	The group agreed that showing the flow on each prototype made the alternatives easier to follow.	Keep the same flow-led explanation when presenting future prototype alternatives.
Lecturer (Course Lecturer)	FIFA Alt 1 and Chess Alt 1 were the most suitable flows during the presentation.	The group recorded this as the lecturer's assessment, separate from the group preference and interview trend.	Use the three viewpoints separately when discussing design choices.
Lecturer (Course Lecturer)	The lecturer questioned why the group's preferred Chess design differed from the option preferred by the people interviewed.	The group linked the difference to domain knowledge, depth and flexibility versus novice convenience and simplicity.	Give greater weight to first-step clarity and decision effort in later Chess comparisons.
Lecturer (Course Lecturer)	The interview trend from five novice interviewees favored Chess Alt 2, while the group initially preferred Alt 3.	The group recognized that visible cards reduce the need to formulate a question before getting useful information.	Carry card-based simplicity and clear priority cues into later Chess decisions without claiming a final redesign here.
